

HackenProof

Leading Web3 bug bounty platform, securing blockchain ecosystems through structured vulnerability disclosure and triage.

TRACTION SCOREBOARD

1

1M ARR (20% YoY growth)

2

166 Clients (70.0% ARR for 3+ years)

3

250 Active programs

4

10M bounty paid (40% YoY growth)

5

55K users (32% YoY growth)

6

54K reports processed (200% YoY growth)

PROBLEM

Velocity spike

- AI-assisted development increases shipping velocity by 2–3×
- Production systems evolve faster than review cycles

Security does not scale

- Skilled auditors are scarce
- Manual review creates SLA bottlenecks
- Static tools are noisy and context-blind

Existing AI ≠ exploit reasoning

- Rule-based detection ≠ economic risk
- Prompt wrappers ≠ trained security models
- No learning from real exploit outcomes

One critical vulnerability can erase \$10–50M+ in value.

Security knowledge is not scaling with ecosystem growth.

SOLUTION

HackenProof owns a proprietary exploit-outcome dataset that cannot be replicated externally.

Scale & Uniqueness

- 50,000+ real vulnerability cases
- Smart contracts + infra
- Paid critical findings
- Continuous new inflow

Model-Grade Labels

Each case includes:

- Final severity (economic impact-based)
- Accepted / rejected / duplicate outcome
- Mediation + remediation context
- Time-to-resolution

This enables supervised exploit reasoning

Structural Defensibility

- Private submission pipeline
- NDA + mediated reports
- Years of historical decisions
- Legally inaccessible to public AI labs

Security AI trained without exploit outcomes is guessing.
We train on economic consequences.

HOW IT WORKS

Early feedback ➔ Less noise ➔ Lower security risk

hBrain — Automated Security Review

File: contracts/Vault.sol
Function: deposit()
Severity: ● CRITICAL

The share calculation:

```
newShares = (msg.value * totalShares) / totalAssets;
```

is precision-sensitive and may allow share inflation under asset imbalance (e.g., donation or rounding manipulation).

This can lead to disproportionate share minting and capital extraction.

Recommended fix: use precision-safe math.

Suggested change:

```
newShares = Math.mulDiv(msg.value, totalShares, totalAssets);
```

hBrain Review — Vault.sol

Findings: Reentrancy in Withdraw()
Severity: ● HIGH

Impact

Attacker can drain funds by re-entering before state update.

Recommended fix

- Apply Checks-Effects-Interactions
- Add `nonReentrant`

Suggested patch (diff)

```
+ (bool ok,) = msg.sender.call{value: amount}("");  
+ require(ok, "transfer failed");  
- balances[msg.sender] -= amount;  
+ balances[msg.sender] -= amount;  
+ (bool ok,) = msg.sender.call{value: amount}("");  
+ require(ok, "transfer failed");
```

MARKET OPPORTUNITY

Developers already trust AI with production code. They just don't trust it with security - yet.

BUSINESS MODEL & REVENUE DRIVERS

ENTERPRISE (SELF-HOSTED)

Model: Annual license

Price: \$50k–150k+

Drivers

- # enterprise customers
- Security-critical repos
- Expansion via integrations

*Expected retention: 90%+
(security-critical infra)*

1

TEAM LICENSES

Model: Per-team annual license

Price: \$5k–20k per team

Drivers

- # teams onboarded
- Conversion from HackenProof clients

*Expansion via additional repos
/ seats*

2

INDIVIDUAL

Model: Monthly subscriptions

Price: \$20 per user

Primary use: ecosystem growth

3

CONSERVATIVE 3-YEAR SCENARIO

- 40 enterprise × \$100k = \$4M
- 150 teams × \$10k = \$1.5M
- = \$5.5M ARR

*Target gross margin: 75–85% at
scale (optimized inference + SaaS
delivery)*

COMPETITION

EXECUTION PLAN

PHASE A — MARGIN EXPANSION (INTERNAL)

What:

Automated triage, duplicate detection, severity reasoning

Why it matters:

Lower operational costs, faster SLAs

(Immediate margin expansion inside HackenProof)

1

PHASE C — ENTERPRISE / PLATFORM EXPANSION

What:

Self-hosted security agent CI/CD gating, audit integrations

Who pays:

Enterprises, infra, regulated teams

(High-ACV contracts and integrations)

3

PHASE B — DEVELOPER TOOLING (PRIMARY REVENUE)

What:

VS Code plugin, GitHub PR reviews

Who pays:

Security-critical dev teams

How it scales:

Per-team and enterprise licenses

(Primary standalone revenue stream)

2

TEAM

Dmytro Matviiv

CEO

Founder and operator of HackenProof. Led company strategy, partnerships, and growth across Web3 security programs.

Alex Horlan

CTO & Head of Security

Built and operated large-scale bug bounty and security triage infrastructure. Deep expertise in exploit severity, mediation, and vulnerability economics.

Artem Derevets

Head of Applied ML

Former Sift, Hedera. Built and operated real-time ML systems at massive scale.

SEED ROUND – CAPITAL PLAN

Round size: \$2M

Target runway: 18–24 months

Target burn: \$85–95k/month

MILESTONES

- Launch hBrain v1 (security-specialized model)
- Ship VS Code + GitHub security plugin
- Secure 10–20 enterprise customers
- \$1-2M ARR
- Achieve 70%+ gross margin
- Enterprise-ready self-hosted deployment

Target outcome: Institutional Series A readiness

USE OF FUNDS
